# Machine Learning: Support Vector Machines 2017/2018

Paulo Novais, Tiago Pinto

- Considerations
  - Loss function
  - Kernel function
  - Dimensionality / non-linearity
  - Parametrization

- Run SVM in R: e1071 package
  - RStudio (Editor de R):

https://download1.rstudio.org/RStudio-1.0.136.exe

R Language:

https://cran.r-project.org/bin/windows/base/

How to install:

install.packages("e1071") & install.packages("xlsx")

- Run SVM in R: e1071 package
  - run:

A = runSVM("C://HVAC24hS16-11-2016--0.xls")

• See:

Package'e1071' user guide (from page 49)

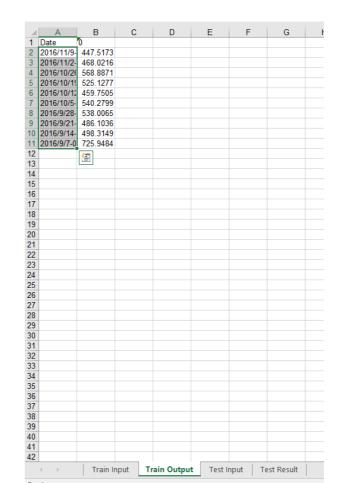

- Example
  - HVAC24hS16-11-2016—0
  - TRAIN INPUT

| 1  | A            | В          | С        | D        | E         | F        | G        | Н        | 1        | J        | K       |
|----|--------------|------------|----------|----------|-----------|----------|----------|----------|----------|----------|---------|
| 1  | Date         |            | 2        |          | 4         | 5        | 6        | 7        | 8        | 9        | 10      |

| 27 |              |            |          |          |           |          |          |          |          |          |         |
| 28 |              |            |          |          |           |          |          |          |          |          |         |
| 29 |              |            |          |          |           |          |          |          |          |          |         |
| 30 |              |            |          |          |           |          |          |          |          |          |         |
| 31 |              |            |          |          |           |          |          |          |          |          |         |
| 32 |              |            |          |          |           |          |          |          |          |          |         |
| 33 |              |            |          |          |           |          |          |          |          |          |         |
| 34 |              |            |          |          |           |          |          |          |          |          |         |
| 35 |              |            |          |          |           |          |          |          |          |          |         |
| 36 |              |            |          |          |           |          |          |          |          |          |         |
| 37 |              |            |          |          |           |          |          |          |          |          |         |
| 38 |              |            |          |          |           |          |          |          |          |          |         |
| 39 |              |            |          |          |           |          |          |          |          |          |         |
| 40 |              |            |          |          |           |          |          |          |          |          |         |
| 41 |              |            |          |          |           |          |          |          |          |          |         |
| 12 |              |            |          |          |           |          |          |          |          |          |         |
| 72 | <b>→</b> T   | rain Input | Train Ou |          | est Input | Test Res | n 1 .    | +)       |          |          |         |

#### Example

- HVAC24hS16-11-2016—0
- TRAIN OUTPUT

- Example
  - HVAC24hS16-11-2016—0
  - TEST INPUT

- Example
  - HVAC24hS16-11-2016—0
  - TEST OUTPUT
    - Should be around 507,66
- Each train input MUST have a train output value
- Test input must have the same number of columns as train input
- Excel file cannot be open during execution
- Must delete Test Result sheet (or just remove / validate the excel writing in the code)

- Exercises
  - Execute the SVM with standard parameterization with the other two excel files

- Exercises
  - Get back to HVAC24hS16-11-2016—0
  - Experiment with only 6 training inputs rather than 10
    - Delete the first three training inputs (and train outputs)
    - Use the fourth training input as test input
    - Compare the test result with the original train output of the same input

#### Exercises

- Repeat this process for 6, 7, 8 and 9 inputs
- Calculate Mean Absolute Percentage Error (MAPE) to assess the error of the predictions
- MAPE: AVERAGE ( (real forecasted) / real )
- Experiment with different parameterizations and compare results (error)
  - Kernel function
  - Epsilon
